NEED STATEMENT: POOJARI BOT

Objectives	Functions	Constraints
Automate basic ritual-support actions (bell ringing, diya lighting, devotional sound).	Accept user command through a push button or switch.	Must operate on low voltage power.
Reduce manual effort in repetitive temple activities.	Receive power supply for operation.	No real fire or hazardous elements.
Provide a safe alternative to open flame using electrical components.	Control sequence of actions using a microcontroller program.	Stable structure to prevent component damage.
Be low-cost and easy to operate for home or small temple use.	Turn ON electric diya (LED).	Low-cost design of about 5000/-.
Demonstrate embedded system design for educational purposes.	Produce devotional sound through speaker/buzzer.	Compact size of about 1-ft^3.
Operate reliably with simple user input (button or switch).	Stop automatically after one cycle.	Easy maintenance and operation.

PROBLEM DEFINATION

Temple ritual-support activities like bell ringing, devotional sound, and diya lighting are repetitive and not always performed consistently. The objective is to design a simple automated system that performs these functions with minimal human effort. The system must accept user input, control outputs reliably, and operate safely within constraints such as low cost, compact size, low power usage, and no open flame.
